

# Relations Defined on Sets

Edmund Woronowicz  
Warsaw University  
Białystok

**Summary.** The article includes theorems concerning properties of relations defined as a subset of the Cartesian product of two sets (mode Relation of  $X, Y$  where  $X, Y$  are sets). Some notions, introduced in [4] such as domain, codomain, field of a relation, composition of relations, image and inverse image of a set under a relation are redefined.

MML Identifier: RELSET\_1.

The articles [2], [1], [3], and [4] provide the notation and terminology for this paper.

We adopt the following convention:  $A, B, X, X_1, Y, Y_1, Y_2, Z$  denote sets and  $a, x, y$  denote sets.

Let us consider  $X, Y$ . Relation between  $X$  and  $Y$  is defined by:

(Def. 1)  $It \subseteq [X, Y]$ .

Let us consider  $X, Y$ . We see that the relation between  $X$  and  $Y$  is a subset of  $[X, Y]$ .

Let us consider  $X, Y$ . Note that every subset of  $[X, Y]$  is relation-like.

In the sequel  $P, R$  denote relations between  $X$  and  $Y$ .

One can prove the following propositions:

- (4)<sup>1</sup> If  $A \subseteq R$ , then  $A$  is a relation between  $X$  and  $Y$ .
- (6)<sup>2</sup> If  $a \in R$ , then there exist  $x, y$  such that  $a = \langle x, y \rangle$  and  $x \in X$  and  $y \in Y$ .
- (8)<sup>3</sup> If  $x \in X$  and  $y \in Y$ , then  $\{\langle x, y \rangle\}$  is a relation between  $X$  and  $Y$ .
- (9) For every binary relation  $R$  such that  $\text{dom} R \subseteq X$  holds  $R$  is a relation between  $X$  and  $\text{rng} R$ .
- (10) For every binary relation  $R$  such that  $\text{rng} R \subseteq Y$  holds  $R$  is a relation between  $\text{dom} R$  and  $Y$ .
- (11) For every binary relation  $R$  such that  $\text{dom} R \subseteq X$  and  $\text{rng} R \subseteq Y$  holds  $R$  is a relation between  $X$  and  $Y$ .
- (12)  $\text{dom} R \subseteq X$  and  $\text{rng} R \subseteq Y$ .
- (13) If  $\text{dom} R \subseteq X_1$ , then  $R$  is a relation between  $X_1$  and  $Y$ .
- (14) If  $\text{rng} R \subseteq Y_1$ , then  $R$  is a relation between  $X$  and  $Y_1$ .
- (15) If  $X \subseteq X_1$ , then  $R$  is a relation between  $X_1$  and  $Y$ .
- (16) If  $Y \subseteq Y_1$ , then  $R$  is a relation between  $X$  and  $Y_1$ .

<sup>1</sup> The propositions (1)–(3) have been removed.

<sup>2</sup> The proposition (5) has been removed.

<sup>3</sup> The proposition (7) has been removed.

(17) If  $X \subseteq X_1$  and  $Y \subseteq Y_1$ , then  $R$  is a relation between  $X_1$  and  $Y_1$ .

Let us consider  $X, Y, P, R$ . Then  $P \cup R$  is a relation between  $X$  and  $Y$ . Then  $P \cap R$  is a relation between  $X$  and  $Y$ . Then  $P \setminus R$  is a relation between  $X$  and  $Y$ .

Let us consider  $X, Y, R$ . Then  $\text{dom} R$  is a subset of  $X$ . Then  $\text{rng} R$  is a subset of  $Y$ .

The following propositions are true:

(19)<sup>4</sup>  $\text{field} R \subseteq X \cup Y$ .

(22)<sup>5</sup> For every  $x$  such that  $x \in X$  there exists  $y$  such that  $\langle x, y \rangle \in R$  iff  $\text{dom} R = X$ .

(23) For every  $y$  such that  $y \in Y$  there exists  $x$  such that  $\langle x, y \rangle \in R$  iff  $\text{rng} R = Y$ .

Let us consider  $X, Y, R$ . Then  $R^\smile$  is a relation between  $Y$  and  $X$ .

Let us consider  $X, Y_1, Y_2, Z$ , let  $P$  be a relation between  $X$  and  $Y_1$ , and let  $R$  be a relation between  $Y_2$  and  $Z$ . Then  $P \cdot R$  is a relation between  $X$  and  $Z$ .

Next we state several propositions:

(24)  $\text{dom}(R^\smile) = \text{rng} R$  and  $\text{rng}(R^\smile) = \text{dom} R$ .

(25)  $\emptyset$  is a relation between  $X$  and  $Y$ .

(26) If  $R$  is a relation between  $\emptyset$  and  $Y$ , then  $R = \emptyset$ .

(27) If  $R$  is a relation between  $X$  and  $\emptyset$ , then  $R = \emptyset$ .

(28)  $\text{id}_X \subseteq [X, X]$ .

(29)  $\text{id}_X$  is a relation between  $X$  and  $X$ .

(30) If  $\text{id}_A \subseteq R$ , then  $A \subseteq \text{dom} R$  and  $A \subseteq \text{rng} R$ .

(31) If  $\text{id}_X \subseteq R$ , then  $X = \text{dom} R$  and  $X \subseteq \text{rng} R$ .

(32) If  $\text{id}_Y \subseteq R$ , then  $Y \subseteq \text{dom} R$  and  $Y = \text{rng} R$ .

Let us consider  $X, Y, R, A$ . Then  $R \upharpoonright A$  is a relation between  $X$  and  $Y$ .

Let us consider  $X, Y, B, R$ . Then  $B \downharpoonright R$  is a relation between  $X$  and  $Y$ .

Next we state four propositions:

(33)  $R \upharpoonright X_1$  is a relation between  $X_1$  and  $Y$ .

(34) If  $X \subseteq X_1$ , then  $R \upharpoonright X_1 = R$ .

(35)  $Y_1 \downharpoonright R$  is a relation between  $X$  and  $Y_1$ .

(36) If  $Y \subseteq Y_1$ , then  $Y_1 \downharpoonright R = R$ .

Let us consider  $X, Y, R, A$ . Then  $R^\circ A$  is a subset of  $Y$ . Then  $R^{-1}(A)$  is a subset of  $X$ .

Next we state two propositions:

(38)<sup>6</sup>  $R^\circ X = \text{rng} R$  and  $R^{-1}(Y) = \text{dom} R$ .

(39)  $R^\circ R^{-1}(Y) = \text{rng} R$  and  $R^{-1}(R^\circ X) = \text{dom} R$ .

The scheme *Rel On Set Ex* deals with a set  $\mathcal{A}$ , a set  $\mathcal{B}$ , and a binary predicate  $\mathcal{P}$ , and states that:

There exists a relation  $R$  between  $\mathcal{A}$  and  $\mathcal{B}$  such that for all  $x, y$  holds  $\langle x, y \rangle \in R$  iff  $x \in \mathcal{A}$  and  $y \in \mathcal{B}$  and  $\mathcal{P}[x, y]$

for all values of the parameters.

Let us consider  $X$ . A binary relation on  $X$  is a relation between  $X$  and  $X$ .

In the sequel  $R$  is a binary relation on  $X$ .

The following proposition is true

<sup>4</sup> The proposition (18) has been removed.

<sup>5</sup> The propositions (20) and (21) have been removed.

<sup>6</sup> The proposition (37) has been removed.

$$(45)^7 \quad R \cdot \text{id}_X = R \text{ and } \text{id}_X \cdot R = R.$$

For simplicity, we adopt the following rules:  $D, D_1, D_2, E, F$  denote non empty sets,  $R$  denotes a relation between  $D$  and  $E$ ,  $x$  denotes an element of  $D$ , and  $y$  denotes an element of  $E$ .

We now state several propositions:

$$(46) \quad \text{id}_D \neq \emptyset.$$

$$(47) \quad \text{For every element } x \text{ of } D \text{ holds } x \in \text{dom}R \text{ iff there exists an element } y \text{ of } E \text{ such that } \langle x, y \rangle \in R.$$

$$(48) \quad \text{For every element } y \text{ of } E \text{ holds } y \in \text{rng}R \text{ iff there exists an element } x \text{ of } D \text{ such that } \langle x, y \rangle \in R.$$

$$(49) \quad \text{For every element } x \text{ of } D \text{ such that } x \in \text{dom}R \text{ there exists an element } y \text{ of } E \text{ such that } y \in \text{rng}R.$$

$$(50) \quad \text{For every element } y \text{ of } E \text{ such that } y \in \text{rng}R \text{ there exists an element } x \text{ of } D \text{ such that } x \in \text{dom}R.$$

$$(51) \quad \text{Let } P \text{ be a relation between } D \text{ and } E, R \text{ be a relation between } E \text{ and } F, x \text{ be an element of } D, \text{ and } z \text{ be an element of } F. \text{ Then } \langle x, z \rangle \in P \cdot R \text{ if and only if there exists an element } y \text{ of } E \text{ such that } \langle x, y \rangle \in P \text{ and } \langle y, z \rangle \in R.$$

$$(52) \quad y \in R^\circ D_1 \text{ iff there exists an element } x \text{ of } D \text{ such that } \langle x, y \rangle \in R \text{ and } x \in D_1.$$

$$(53) \quad x \in R^{-1}(D_2) \text{ iff there exists an element } y \text{ of } E \text{ such that } \langle x, y \rangle \in R \text{ and } y \in D_2.$$

The scheme *Rel On Dom Ex* deals with non empty sets  $\mathcal{A}, \mathcal{B}$  and a binary predicate  $\mathcal{P}$ , and states that:

There exists a relation  $R$  between  $\mathcal{A}$  and  $\mathcal{B}$  such that for every element  $x$  of  $\mathcal{A}$  and for every element  $y$  of  $\mathcal{B}$  holds  $\langle x, y \rangle \in R$  if and only if  $\mathcal{P}[x, y]$  for all values of the parameters.
