## The NASA STI Program Office ... in Profile

Since its founding, NASA has been dedicated to the advancement of aeronautics and space science. The NASA Scientific and Technical Information (STI) Program Office plays a key part in helping NASA maintain this important role.

The NASA STI Program Office is operated by Langley Research Center, the lead center for NASA's scientific and technical information. The NASA STI Program Office provides access to the NASA STI Database, the largest collection of aeronautical and space science STI in the world. The Program Office is also NASA's institutional mechanism for disseminating the results of its research and development activities. These results are published by NASA in the NASA STI Report Series, which includes the following report types:

- **TECHNICAL PUBLICATION.** Reports of completed research or a major significant phase of research that present the results of NASA programs and include extensive data or theoretical analysis. Includes compilations of significant scientific and technical data and information deemed to be of continuing reference value. NASA counterpart of peer-reviewed formal professional papers, but having less stringent limitations on manuscript length and extent of graphic presentations.
- **TECHNICAL MEMORANDUM.** Scientific and technical findings that are preliminary or of specialized interest, e.g., quick release reports, working papers, and bibliographies that contain minimal annotation. Does not contain extensive analysis.
- **CONTRACTOR REPORT.** Scientific and technical findings by NASA-sponsored contractors and grantees.

- **CONFERENCE PUBLICATION.** Collected papers from scientific and technical conferences, symposia, seminars, or other meetings sponsored or co-sponsored by NASA.
- **SPECIAL PUBLICATION.** Scientific, technical, or historical information from NASA programs, projects, and missions, often concerned with subjects having substantial public interest.
- **TECHNICAL TRANSLATION.** English-language translations of foreign scientific and technical material pertinent to NASA's mission.

Specialized services that complement the STI Program Office's diverse offerings include creating custom thesauri, building customized databases, organizing and publishing research results ... even providing videos.

For more information about the NASA STI Program Office, see the following:

- Access the NASA STI Program Home Page at <http://www.sti.nasa.gov>
- E-mail your question via the Internet to [help@sti.nasa.gov](mailto:help@sti.nasa.gov)
- Fax your question to the NASA STI Help Desk at (301) 621-0134
- Phone the NASA STI Help Desk at (301) 621-0390

## **1.0 Introduction**

To be effective in wake vortex prediction the Aircraft Vortex Spacing System (AVOSS) algorithms (ref. 1) require wind profiles through the lower part of the atmospheric boundary layer. Atmospheric turbulence data is also required in the AVOSS prediction algorithms. The turbulent kinetic energy (TKE) measured at the Dallas Fort-Worth Airport (DFW) was used to represent atmospheric turbulence. It was desired to test AVOSS using the wind and turbulence data collected at DFW during the period from January 1998 through January 1999. Volume 1 describes the data sources, the process, and the criteria used to determine the overall representativeness of the AVOSS Winds Analysis System (AWAS) merged wind profiles and their variances for given times and altitudes. This volume documents the file processing and sorting accomplished for AVOSS application and presents the results of the data quality analyses.

Wind components representing head wind and tail wind for the North-South runways at the Dallas-Fort Worth Airport (DFW) were available every 5 minutes from AWAS. These were running averages representing either a 15 or 30 minute period prior to and after June 14, 1998, respectively. Several levels of processing reduced this original data set as shown in Figure 1. Sorting occurred for selected times of day, overlapping averages, availability of turbulence data, cloud and visibility information, and for the quality process described in Volume 1. Each level of sorting is described below.

## **2.0 Data Processing**

It is important to note that no data were actually changed during either the quality analysis (QA) process or the sorting-filtering process. For the QA, described in Volume 1, flags were added as an additional column in the appropriate data files depending on whether or not the criteria were met. Similarly, the data processing required to produce the various subsets described herein did not change the original data. It only reduced the number of files available for each level of sorting or filtering in order to facilitate AVOSS applications. A data file is a collection of wind components and variances at given altitudes for a given time period. For example, the file available January 23<sup>rd</sup> at 1415 UTC consisted of a header with the date and time, as well as other information, followed by data records corresponding to altitudes above the ground. File formats are described in reference 2. For each altitude there was a U-component, V-component, U-variance, and V-variance.

### **2.1 Local Time**

It was desired to associate the original AVOSS processing with times of day corresponding to the vast majority of arrival and departure operations. Therefore, the time period of 8:00 AM to 10:00 PM Dallas local time was selected as the period of interest. Because local time changes by one hour twice a year, the local time processor must make the appropriate choices from the Universal Time reported in the file names. This reduced the number of files nearly in half.

### **2.2 Overlap**

Wind profiles were available approximately every 5 minutes during this entire 13-month period. Since averaging periods represented either a 15 or 30 minute running average, only files on the hour, half hour or quarter hour were selected for AVOSS execution. That further reduced the number of files by 1/3 or 1/6 depending on a 15 minute average or 30 minute average, respectively. In other words, AVOSS only produces wake vortex predictions every 15 or 30 minutes and ignores overlapping weather files. Although the nominal time between files was 5 minutes, it was usually a little longer. Because of that,

files were rarely available at the exact time desired (on the quarter hours). A file that was within 4 minutes of the desired time was considered as satisfying the desired time. In cases where two files were within 4 minutes of the desired time, the one closest to the desired time was used. An example of this would be when looking for a file at 10:15:00 there might be a file available at 10:12:43 and one at 10:17:56. In this case the file at 10:12:43 would be retained since it is the closest to 10:15:00. This closest time procedure also applied when selecting files for the desired local time range. Therefore a file at 7:58:22 AM would be considered within the 8:00 AM to 10:00 PM range.

## **2.3 TKE Availability**

The AVOSS algorithms in use at the time of this study require atmospheric turbulence information represented by TKE measured at DFW. Only those dates and times were selected when there was TKE data from a tower at the airport. Measurements were made at two levels using sonic anemometers. The 1 minute average from 10 samples per second at 40 m level was the primary input, but 5 m measurements were substituted if the 40 m value was missing. After this study was completed, modifications to the AVOSS predictors were made to use eddy dissipation rate for the wake decay parameter.

## **2.4 Cloud and Visibility**

Cloud coverage and visibility were available each hour (or more often when special conditions occurred) from a surface weather observation via an augmented Automatic Surface Observing System (ASOS) at the DFW airport. Whenever a ceiling (defined as the lowest layer of broken or overcast clouds) was reported at 5000 ft or below, or when prevailing visibility was 5 miles or less, the values for each were associated with the remaining AWAS files in that time period.

## **2.5 Quality Assessment**

Since the dates, times, and altitudes of AWAS records were marked for a variety of quality indicators as discussed in Volume 1, any subset could be combined with a selected indicator in the quality assessed file to produce additional filtered data subsets for subsequent AVOSS runs.

## **3.0 Data Spreadsheet Definition**

The spreadsheet containing the files remaining after the time, overlap, and TKE filters were applied are listed in the Appendix. It contains seven columns: A) the AWAS file name, B) the UTC date of the file, C) the UTC time of the file, D) the local time offset in hours (subtract this number of hours from column C and make necessary adjustments to column B to get Dallas local time), E) the reported ceiling, if 5000 feet or less, at the file time, F) the reported visibility, if 5 miles or less, and G) an indicator of the quality of the data (see the QA process). In the ceiling (E) and visibility (F) columns, NA means that no ASOS data was available.

### **3.1 Format**

The spreadsheet is provided with the data files in comma separated variable (csv) format so that it can be easily read into most spreadsheet programs.

### 3.2 Sorting procedures

The sorting procedures and examples described here use Microsoft EXCEL as the spreadsheet program. To determine which files were recorded when the ceiling was 5000' or less, simply sort on column E and select all files where column E is neither blank nor has a NA in the column. A more complicated example would be to find the files where the ceiling was 3900' or less, and the visibility was 4 miles or less, and the AWAS passed the QA criteria. The list of files for these conditions could be found by using the Advanced Filter (Filter submenu on the Data menu). The filter criteria would be set up using column headings from E – ceiling, F – visibility, and G – QA Flag (see Table 1). The example shows the result of this filter when “filter the list, in-place” is chosen. The names of the files passing this criteria are listed in column A.

Table 1: Example of Selecting Files with Excel Advanced Filter

### 4.0 Summary and Conclusions

Several file processing steps were executed on the wind, turbulence, and ASOS data available from DFW so as to preserve essential information needed to run AVOSS. First, the period of interest was determined to be 8 AM to 10 PM Local Time so that other times were excluded. Second, to preserve independence as well as to reduce the number of files, the large set of wind profiles was reduced by a factor of 3 or 6 by selecting only files on the hour, half hour, or quarter hour depending on the June 14<sup>th</sup> date when the averaging changed from 15 to 30 minutes. Third, only times when valid turbulence measurements existed were used. Forth, ceiling and visibility information was added to the remaining file list. Last, wind

profiles for the remaining times were identified with quality indicators. The net result is a spreadsheet that can be sorted to include subsets of interest and file times identified for execution of the AVOSS code.

## **Abbreviations**

ASOS	Automatic Surface Observing System
AVOSS	Aircraft Vortex Spacing System
AWAS	AVOSS Winds Analysis System
DFW	Dallas-Fort Worth International Airport
NA	not available
QA	quality analysis
TKE	turbulent kinetic energy
UTC	Universaile Tempes du Coordinaire' (universal time)

13. ABSTRACT (Maximum 200 words) The NASA Langley Research Center's Aircraft Vortex Spacing System (AVOSS) requires accurate winds and turbulence to determine aircraft wake vortex behavior near the ground. Volume 1 described the wind input and quality analysis process. This volume documents the data available during the period January 1998 through January 1999 and the partitioning and concatenation of files for time of day, turbulence, non duplication, cross wind profile quality and ceiling and visibility. It provides the resultant filtered files for the first three partitions as well as identification of ceiling/visibility conditions when they were below 5000 feet and 5 miles respectively. It also includes the wind profile quality flags to permit automatic selection of files for AVOSS application using selected ceiling/visibility and wind profile quality values and flags (or no flags).				
14. SUBJECT TERMS AVOSS; Wake vortex; Atmospheric boundary layer winds; TKE wind profiles			15. NUMBER OF PAGES 232
